1 Introduction

Let X, Y, \dots be sets

Definition. We call $\mathcal{A} \subset \mathcal{P}(X)$ a **set system** or **family of sets**. \mathcal{A} is naturally identified with a bipartite graph $G_{\mathcal{A}}(U, W)$ with $U = \mathcal{A}$, $W = \bigcup_{A \in \mathcal{A}} A$ or $W = X$. Indeed, $Ax \in E(G_{\mathcal{A}}) \iff x \in A$.

Definition. Given $\mathcal{A} \subset \mathcal{P}(X)$, a **set of distinct representatives (SDR)** is an injection $f : \mathcal{A} \rightarrow X$ s.t. $f(A) \in A \forall A \in \mathcal{A}$. In its bipartite graph, an SDR corresponds to a complete matching $U \rightarrow W$.

Theorem 1 (Hall, 1935). A set system \mathcal{A} has an SDR if $\forall \mathcal{A}' \subset \mathcal{A}$, $|\bigcup_{A \in \mathcal{A}'} A| \geq |\mathcal{A}'|$.

Theorem 1'. A bipartite graph $G(U, W)$ has a complete matching $U \rightarrow W$ if $\forall S \subset U$, $|\Gamma(S)| \geq |S|$

Corollary 2. Suppose $G(U, W)$ bipartite, $d(u) \geq d(w) \forall u \in U, w \in W$. Then \exists a complete matching $U \rightarrow W$.

Definition. A bipartite graph $G(U, W)$ is **(r, s) -regular** if $d(u) = r$ and $d(w) = s \forall u \in U, w \in W$.

Instant from Cor 2: if $G(U, W)$ is (r, s) -regular then \exists a complete matching from U to W if $|U| \leq |W|$.

Corollary 3. Let $0 \leq i, j \leq n$, $\binom{n}{i} \leq \binom{n}{j}$. Then \exists a complete matching $f : [n]^{(i)} \rightarrow [n]^{(j)}$ s.t. $f(A) \subset A$ if $j \leq i$, and $f(A) \supset A$ if $i \leq j$.

Theorem 4. Let $G = G(U, W)$ be a connected (r, s) -regular graph. Then for $\emptyset \neq A \subset U$,

$$\frac{|\Gamma(A)|}{|W|} \geq \frac{|A|}{|U|}$$

Also, equality holds iff $A = U$.

The **cube** $Q^n \cong \mathcal{P}(n) \cong [2]^n$ = set of all 0, 1 sequences of length n . Q^n is also a graph: AB is an edge if $|A \triangle B| = 1$. It is also a poset: $A < B$ if $A \subset B$.

Q^n has a natural orientation: \overrightarrow{AB} if $A = B \cup \{a\}$.

The order on $Q^n \cong \mathcal{P}(n)$ is induced by this oriented graph.

2 Sperner Systems

Definition. A set system $\mathcal{A} \subset \mathcal{P}(n)$ is **Sperner** if $A, B \in \mathcal{A}$, $A \neq B \implies A \not\subset B$

Theorem 1 (Sperner, 1928). If $\mathcal{A} \subset \mathcal{P}(n)$ is Sperner then

$$|\mathcal{A}| \leq \binom{n}{\lfloor \frac{n}{2} \rfloor}$$

Definition. The **weight** $w(A)$ of a set $A \in \mathcal{P}(n)$ is $w(A) = \frac{1}{\binom{n}{|A|}}$

Theorem 2. Let \mathcal{A} be a Sperner system on X , $|X| = n$. Then

$$w(\mathcal{A}) = \sum_{A \in \mathcal{A}} w(A) \leq 1$$
